

# Package: mapboxapi (via r-universe)

September 6, 2024

**Type** Package

**Title** R Interface to 'Mapbox' Web Services

**Date** 2024-09-06

**Version** 0.6.2

**Maintainer** Kyle Walker <kyle@walker-data.com>

**Description** Includes support for 'Mapbox' Navigation APIs, including directions, isochrones, and route optimization; the Search API for forward and reverse geocoding; the Maps API for interacting with 'Mapbox' vector tilesets and visualizing 'Mapbox' maps in R; and 'Mapbox Tiling Service' and 'tippecanoe' for generating map tiles. See <<https://docs.mapbox.com/api/>> for more information about the 'Mapbox' APIs.

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**URL** <https://github.com/walkerke/mapboxapi>,  
<https://walker-data.com/mapboxapi/>

**BugReports** <https://github.com/walkerke/mapboxapi/issues>

**Depends** R (>= 3.3.0)

**Imports** httr, sf, jsonlite, purrr, curl, dplyr (>= 1.0.0), tidyr (>= 1.0.0), aws.s3, stringi, slippymath, protolite, rlang, geojsonsf, magick, leaflet, units, raster, png, jpeg, htmltools

**Suggests** ggspatial, grDevices, mapdeck, tigris, tidycensus, tmap, mapboxer, testthat (>= 3.0.0)

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.1

**Config/testthat/edition** 3

**Repository** <https://walkerke.r-universe.dev>

**RemoteUrl** <https://github.com/walkerke/mapboxapi>

**RemoteRef** HEAD

**RemoteSha** 9e00a3bdf94baf32a5273bcc85f8f3b12ea8eb4

addMapboxTiles

*Use a Mapbox style in a Leaflet map*

---

### Description

See the [Mapbox Static Tiles API documentation](#) for more information.

**Usage**

```
addMapboxTiles(
  map,
  style_id,
  username,
  style_url = NULL,
  scaling_factor = c("1x", "0.5x", "2x"),
  access_token = NULL,
  layerId = NULL,
  group = NULL,
  options = leaflet::tileOptions(),
  data = leaflet::getMapData(map),
  attribution = TRUE
)
```

**Arguments**

map	A map widget object created by <code>leaflet::leaflet()</code>
style_id	The style ID of a Mapbox style
username	A Mapbox username
style_url	A Mapbox style URL
scaling_factor	The scaling factor to use when rendering the tiles. A scaling factor of "1x" (the default) returns 512px by 512px tiles. A factor of "1x" returns 256x256 tiles, and a factor of "2x" returns 1024x1024 tiles.
access_token	Your Mapbox access token; which can be set with <code>mb_access_token()</code> .
layerId	the layer ID
group	The name of the group the Mapbox tile layer should belong to (for use in Shiny and to modify layers control in a Leaflet workflow)
options	A list of extra options (optional)
data	The data object used to derive argument values; can be provided to the initial call to <code>leaflet::leaflet()</code>
attribution	If TRUE, pass a standard attribution to <code>leaflet::addTiles()</code> . If FALSE, attribution is NULL. attribution can also be a character string including HTML.

**Value**

A pointer to the Mapbox Static Tiles API which will be translated appropriately by the leaflet R package.

**Examples**

```
## Not run:

library(leaflet)
library(mapboxapi)
```

```

leaflet() %>%
  addMapboxTiles(
    style_id = "light-v9",
    username = "mapbox"
  ) %>%
  setView(
    lng = -74.0051,
    lat = 40.7251,
    zoom = 13
  )

## End(Not run)

```

---

check\_upload\_status     *Check the status of a Mapbox upload*

---

### Description

Check the status of a Mapbox upload

### Usage

```
check_upload_status(upload_id, username, access_token = NULL)
```

### Arguments

upload_id	The upload ID
username	Your account's username
access_token	Your Mapbox access token

---

feature\_options     *Specify feature options for an MTS recipe layer*

---

### Description

Specify feature options for an MTS recipe layer

### Usage

```

feature_options(
  id = NULL,
  bbox = NULL,
  attributes = list(zoom_element = NULL, set = NULL, allowed_output = NULL),
  filter = NULL,
  simplification = NULL
)

```

## Arguments

id	A column representing the feature ID. See <a href="https://docs.mapbox.com/mapbox-tiling-service/reference/#id-expression">https://docs.mapbox.com/mapbox-tiling-service/reference/#id-expression</a> .
bbox	A bounding box within which rendered features will be clipped. See <a href="https://docs.mapbox.com/mapbox-tiling-service/reference/#bounding-box">https://docs.mapbox.com/mapbox-tiling-service/reference/#bounding-box</a> .
attributes	A named list of attribute transformations. <code>zoom_element</code> specifies how an attribute should be made available at different zoom levels; <code>set</code> allows you to calculate new attributes from existing attributes when processing the tiles; and <code>allowed_output</code> specifies which columns should be carried through to the output tiles. See <a href="https://docs.mapbox.com/mapbox-tiling-service/reference/#feature-attributes">https://docs.mapbox.com/mapbox-tiling-service/reference/#feature-attributes</a> .
filter	An expression that determines how features in the tileset should be filtered. See <a href="https://docs.mapbox.com/mapbox-tiling-service/reference/#feature-filters">https://docs.mapbox.com/mapbox-tiling-service/reference/#feature-filters</a> for information on how to specify the filter.
simplification	Rules for feature simplification. See <a href="https://docs.mapbox.com/mapbox-tiling-service/reference/#feature-simplification">https://docs.mapbox.com/mapbox-tiling-service/reference/#feature-simplification</a> for more information on how to specify this.

## Value

A list of feature options, likely to be used in `recipe_layer()`.

## See Also

<https://docs.mapbox.com/mapbox-tiling-service/reference/>

## Examples

```
## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age
us_median_age_tract <- get_acs(
  geography = "tract",
  variables = "B01002_001",
  state = c(state.abb, "DC"),
  year = 2020,
  geometry = TRUE
)

# Get it for counties as well
us_median_age_county <- get_acs(
  geography = "county",
  variables = "B01002_001",
  year = 2020,
  geometry = TRUE
)
```

```
# Create a source from the datasets
mts_create_source(data = us_median_age_tract,
                  tileset_id = "us_median_age_tract",
                  username = "your_mapbox_username")

mts_create_source(data = us_median_age_county,
                  tileset_id = "us_median_age_county",
                  username = "your_mapbox_username")

# Build out the recipe. First, create a recipe layer with
# appropriate options. We'll want a larger tile size and to restrict the minzoom
# to 4; a maxzoom of 12 will be fine as we can overzoom beyond that
#
# Your source ID will be returned by `mts_create_source()`, so use that value
tract_layer <- recipe_layer(
  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_tract",
  minzoom = 4,
  maxzoom = 12,
  tiles = tile_options(layer_size = 2500)
)

county_layer <- recipe_layer(
  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_county",
  minzoom = 2,
  maxzoom = 5
)

recipe <- mts_make_recipe(tracts = tract_layer, counties = county_layer)

# Validate the recipe
mts_validate_recipe(recipe)

# Create a tileset from the recipe
mts_create_tileset(tileset_name = "median_age_acs",
                  username = "your_mapbox_username",
                  recipe = recipe)

# Publish the tileset
mts_publish_tileset(tileset_name = "median_age_acs",
                   username = "your_mapbox_username")

# If necessary, update the recipe
mts_update_recipe(tileset_name = "median_age_acs",
                 username = "your_mapbox_username",
                 recipe = new_recipe)

# Publish the tileset again after you've updated the recipe
mts_publish_tileset(tileset_name = "median_age_acs",
                   username = "your_mapbox_username")

## End(Not run)
```

---

geocoder_as_sf	<i>Convert the result of a mapboxGeocoderInput() geocoded location to an sf object</i>
----------------	--

---

**Description**

Convert the result of a mapboxGeocoderInput() geocoded location to an sf object

**Usage**

```
geocoder_as_sf(input)
```

**Arguments**

input	The name of the Shiny input using mapboxGeocoderInput(), likely something like input\$geocode
-------	---

**Value**

An sf object that can be used downstream in your Shiny applications.

---

geocoder_as_xy	<i>Convert the results of a mapboxGeocoderInput() geocoded location to XY coordinates</i>
----------------	---

---

**Description**

Convert the results of a mapboxGeocoderInput() geocoded location to XY coordinates

**Usage**

```
geocoder_as_xy(input)
```

**Arguments**

input	The name of the Shiny input using mapboxGeocoderInput(), likely something like input\$geocode
-------	---

**Value**

A length-2 vector representing the geocoded longitude/latitude coordinates of the location.

---

get\_static\_tiles      *Get static tiles from a Mapbox style for use as a basemap*

---

### Description

This function queries the [Mapbox Static Tiles API](#) and composites the tiles as a raster suitable for use as a basemap in `tmap` or `ggplot2` (with the `ggspatial::layer_spatial()` function). It returns a raster layer that corresponds either to an input bounding box or a buffered area around an input shape.

### Usage

```
get_static_tiles(
  location,
  zoom,
  style_id,
  username,
  style_url = NULL,
  scaling_factor = c("1x", "2x"),
  buffer_dist = 5000,
  units = "m",
  crop = TRUE,
  access_token = NULL
)
```

### Arguments

location	An input location for which you would like to request tiles. Can be a length-4 vector representing a bounding box, or an <code>sf</code> object. If an input <code>sf</code> object is supplied, use the <code>buffer_dist</code> argument to control how much area you want to capture around the layer. While the input <code>sf</code> object can be in an arbitrary coordinate reference system, if a length-4 bounding box vector is supplied instead it must represent WGS84 longitude/latitude coordinates and be in the order <code>c(xmin, ymin, xmax, ymax)</code> .
zoom	The zoom level for which you'd like to return tiles.
style_id	A Mapbox style ID; retrieve yours from your Mapbox account.
username	A Mapbox username.
style_url	A Mapbox style URL.
scaling_factor	The scaling factor to use; one of "1x" or "2x".
buffer_dist	The distance to buffer around an input <code>sf</code> object for determining tile extent, specified in units. Defaults to 5000.
units	Units of <code>buffer_dist</code> ; defaults to "m" (meters). If <code>buffer_dist</code> is a units class object, the units argument is ignored.
crop	Whether or not to crop the result to the specified bounding box or buffer area. Defaults to TRUE; FALSE will return the extent of the overlapping tiles.

`access_token` A Mapbox access token. Supply yours here or set globally with the `mb_access_token()` function.

### Value

A raster layer of tiles from the requested Mapbox style representing the area around the input location. The raster layer is projected in the Web Mercator coordinate reference system.

### Examples

```
## Not run:

library(mapboxapi)
library(tigris)
library(tmap)
library(ggspatial)
library(ggplot2)

ny_tracts <- tracts("NY", "New York", cb = TRUE)

ny_tiles <- get_static_tiles(
  location = ny_tracts,
  zoom = 10,
  style_id = "light-v9",
  username = "mapbox"
)

# tmap usage:
tm_shape(ny_tiles) +
  tm_rgb() +
  tm_shape(ny_tracts) +
  tm_polygons(alpha = 0.5, col = "navy") +
  tm_credits("Basemap (c) Mapbox, (c) OpenStreetMap",
    position = c("RIGHT", "BOTTOM")
  )

# ggplot2 usage:
ggplot() +
  layer_spatial(ny_tiles) +
  geom_sf(data = ny_tracts, fill = "navy", alpha = 0.5) +
  theme_void() +
  labs(caption = "Basemap (c) Mapbox, (c) OpenStreetMap")

## End(Not run)
```

**Description**

See the [Mapbox Styles API](#) documentation for more information.

**Usage**

```
get_style(style_id, username, style_url = NULL, access_token = NULL)
```

```
list_styles(username, access_token = NULL)
```

**Arguments**

style_id	A style ID
username	A Mapbox username
style_url	A Mapbox style URL
access_token	A Mapbox public or secret access token; set with <a href="#">mb_access_token()</a>

**Value**

[get\\_style](#) returns a list of information about your selected style. [list\\_styles](#) returns a data frame of information about styles from a Mapbox account

---

get_vector_tiles	<i>Retrieve vector tiles from a given Mapbox tileset</i>
------------------	--

---

**Description**

Retrieve vector tiles from a given Mapbox tileset

**Usage**

```
get_vector_tiles(tileset_id, location, zoom, access_token = NULL)
```

**Arguments**

tileset_id	The name of the tileset ID; names can be retrieved from your Mapbox account
location	The location for which you'd like to retrieve tiles. If the input is an sf object, the function will return data for all tiles that intersect the object's bounding box. If the input is a coordinate pair or an address, data will be returned for the specific tile that contains the input.
zoom	The zoom level of the request; larger zoom levels will return more detail but will take longer to process.
access_token	A Mapbox access token; which can be set with <a href="#">mb_access_token()</a> .

**Value**

A list of sf objects representing the different layer types found in the requested vector tiles.

## Examples

```
## Not run:

library(mapboxapi)
library(ggplot2)

vector_extract <- get_vector_tiles(
  tileset_id = "mapbox.mapbox-streets-v8",
  location = c(-73.99405, 40.72033),
  zoom = 15
)

ggplot(vector_extract$building$polygons) +
  geom_sf() +
  theme_void()

## End(Not run)
```

---

layer\_static\_mapbox    *Make a static Mapbox ggplot2 layer or tmap basemap*

---

## Description

These functions wrap `static_mapbox()` and `ggspatial::layer_spatial()` or `tmap::tm_rgb()` to support the use of images from the [Mapbox Static Maps API](#) as `ggplot2` or `tmap` basemaps.

## Usage

```
layer_static_mapbox(
  location = NULL,
  buffer_dist = 1000,
  units = "m",
  style_id,
  username,
  style_url = NULL,
  overlay_sf = NULL,
  overlay_style = NULL,
  overlay_markers = NULL,
  width = NULL,
  height = NULL,
  scale = 0.5,
  scaling_factor = c("1x", "2x"),
  attribution = TRUE,
  logo = TRUE,
  before_layer = NULL,
  access_token = NULL,
  ...
)
```

```

)

tm_static_mapbox(
  location = NULL,
  buffer_dist = 1000,
  units = "m",
  style_id,
  username,
  style_url = NULL,
  overlay_sf = NULL,
  overlay_style = NULL,
  overlay_markers = NULL,
  width = NULL,
  height = NULL,
  scale = 0.5,
  scaling_factor = c("1x", "2x"),
  attribution = TRUE,
  logo = TRUE,
  before_layer = NULL,
  access_token = NULL,
  ...
)

```

### Arguments

location	An input location for which you would like to request tiles. Can be a length-4 vector representing a bounding box, or an <code>sf</code> object. If an input <code>sf</code> object is supplied, use the <code>buffer_dist</code> argument to control how much area you want to capture around the layer. While the input <code>sf</code> object can be in an arbitrary coordinate reference system, if a length-4 bounding box vector is supplied instead it must represent WGS84 longitude/latitude coordinates and be in the order <code>c(xmin, ymin, xmax, ymax)</code> .
buffer_dist	The distance to buffer around an input <code>sf</code> object for determining static map, specified in units. If <code>location</code> is a <code>POINT</code> object of 2 rows or less and <code>buffer_dist</code> is 0 or <code>NULL</code> , a 1 unit buffer is applied to try to ensure the creation of a valid bounding box for the map area.
units	Units of <code>buffer_dist</code> ; defaults to "m" (meters). If <code>buffer_dist</code> is a units class object, the units argument is ignored.
style_id	A style ID (required if <code>style_url</code> is <code>NULL</code> ).
username	A Mapbox username (required if <code>style_url</code> = <code>NULL</code> ).
style_url	A Mapbox style url; defaults to <code>NULL</code> .
overlay_sf	The overlay <code>sf</code> object (optional). The function will convert the <code>sf</code> object to GeoJSON then plot over the basemap style. Spatial data that are too large will trigger an error, and should be added to the style in Mapbox Studio instead.
overlay_style	A named list of vectors specifying how to style the <code>sf</code> overlay. Possible names are "stroke", "stroke-width" (or "stroke_width"), "stroke-opacity" (or "stroke_opacity"), "fill", and "fill-opacity" (or "fill_opacity"). The fill and stroke color values can

be specified as six-digit hex codes or color names, and the opacity and width values should be supplied as floating-point numbers. If `overlay_style` is `NULL`, the style values can be pulled from columns with the same names in `overlay_sf`.

<code>overlay_markers</code>	The prepared overlay markers (optional). See the function <a href="#">prep_overlay_markers</a> for more information on how to specify a marker overlay.
<code>width, height</code>	The map width and height; defaults to <code>NULL</code>
<code>scale</code>	ratio to scale the output image; <code>scale = 1</code> will return the largest possible image. defaults to <code>0.5</code>
<code>scaling_factor</code>	The scaling factor of the tiles; either "1x" (the default) or "2x"
<code>attribution</code>	Controls whether there is attribution on the image. Defaults to <code>TRUE</code> . If <code>FALSE</code> , the watermarked attribution is removed from the image. You still have a legal responsibility to attribute maps that use <code>OpenStreetMap</code> data, which includes most maps from <code>Mapbox</code> . If you specify <code>attribution = FALSE</code> , you are legally required to include proper attribution elsewhere on the webpage or document.
<code>logo</code>	Controls whether there is a <code>Mapbox</code> logo on the image. Defaults to <code>TRUE</code> .
<code>before_layer</code>	A character string that specifies where in the hierarchy of layer elements the overlay should be inserted. The overlay will be placed just above the specified layer in the given <code>Mapbox</code> styles. List layer ids for a map style with <code>get_style(style_id = style_id, username = username, style_url = style_url, access_token = access_token)[["layers"]][["id"]]</code>
<code>access_token</code>	A <code>Mapbox</code> access token; which can be set with <a href="#">mb_access_token</a> .
<code>...</code>	additional parameters passed to <a href="#">ggspatial::layer_spatial</a> or <a href="#">tmap::tm_rgb</a>

## Details

This function uses a different approach than [get\\_static\\_tiles\(\)](#). Instead, [layer\\_static\\_mapbox\(\)](#) is based largely on [layer\\_mapbox\(\)](#) in the `snapbox` package (available under a [MIT license](#)). There are a few key differences between [layer\\_static\\_mapbox\(\)](#) and [layer\\_mapbox\(\)](#). The "scale" parameter is equivalent to the "scale\_ratio" parameter for `snapbox`. Setting `scale_factor = "2x"` is equivalent to setting `retina = TRUE`. Both functions return basemaps that are no larger than a single tile (a maximum of 1280 by 1280 pixels).

For [tm\\_static\\_mapbox\(\)](#), [tmap::tm\\_shape](#) is called with `projection = 3857` and [tmap::tm\\_rgb](#) is called with `max.value = 1`.

---

mapboxGeocoderInput*Use Mapbox's Geocoder widget in a Shiny application*

---

**Description**

Use Mapbox's Geocoder widget in a Shiny application

**Usage**

```
mapboxGeocoderInput(  
  inputId,  
  access_token = NULL,  
  placeholder = "Search",  
  search_within = NULL,  
  proximity = NULL,  
  limit = 5,  
  min_length = 2,  
  language = NULL  
)
```

**Arguments**

inputId	The Shiny input ID
access_token	The Mapbox access token (required); can be set with <code>mb_access_token()</code>
placeholder	The placeholder to be used in the search box; defaults to 'Search'
search_within	An sf object, or vector representing a bounding box of format <code>c(min_longitude, min_latitude, max_longitude, max_latitude)</code> used to limit search results. Defaults to NULL.
proximity	A length-2 vector of longitude and latitude coordinates used to prioritize results near to that location. Defaults to NULL.
limit	The maximum number of results to show. Defaults to 5.
min_length	The minimum number of characters the user must enter before results are shown. Defaults to 2.
language	The language to use for the geocoder. Per the Mapbox documentation, "Options are IETF language tags comprised of a mandatory ISO 639-1 language code and optionally one or more IETF subtags for country or script."

**Value**

A Mapbox geocoder widget as a Shiny input

---

mb_access_token	<i>Install or retrieve a Mapbox access token in your .Renviron for repeated use</i>
-----------------	---

---

**Description**

See the Mapbox API documentation for [more information on access tokens and token scopes](#).

**Usage**

```
mb_access_token(token, overwrite = FALSE, install = FALSE)

get_mb_access_token(
  token = NULL,
  default = c("MAPBOX_PUBLIC_TOKEN", "MAPBOX_SECRET_TOKEN"),
  secret_required = FALSE
)

list_tokens(
  username,
  default = NULL,
  limit = NULL,
  sortby = "created",
  usage = NULL,
  access_token = NULL
)
```

**Arguments**

token	A Mapbox access token; can be public (starting with 'pk') or secret (starting with 'sk') scope, which the function will interpret for you.
overwrite	Whether or not to overwrite an existing Mapbox access token. Defaults to FALSE.
install	if TRUE, will install the key in your .Renviron file for use in future sessions. Defaults to FALSE.
default	If TRUE, will only include the default token for an account. If FALSE, will include all other tokens except for the default. Defaults to NULL.
secret_required	If TRUE, a secret token is required. If FALSE, the default token is provided first and the other token provided second if the first is unavailable.
username	The Mapbox username for which you'd like to list access tokens.
limit	The maximum number of tokens to return. Defaults to NULL.
sortby	How to sort the returned tokens; one of "created" or "modified".
usage	If "pk", returns only public tokens; if "sk", returns only secret tokens. Defaults to NULL, which returns all tokens in the scope of the supplied access token.
access_token	Your Mapbox access token. If left NULL, will first check to see if you have a secret token stored in .Renviron, then a public token.

**Value**

A tibble of information about tokens in your Mapbox account.

**Examples**

```
## Not run:
my_token <- "..." # The token generated from your Mapbox account
mb_access_token(my_token, install = TRUE)
Sys.getenv("MAPBOX_PUBLIC_TOKEN")

get_mb_access_token()

## End(Not run)
## Not run:

token_list <- list_tokens(
  username = "kwalkertcu", # You would use your own username here
  limit = 10,
  sortby = "modified" #'
)

## End(Not run)
```

---

mb_batch_geocode	<i>Geocode addresses or locations in bulk using the Mapbox Batch Geocoding API</i>
------------------	--

---

### Description

Geocode addresses or locations in bulk using the Mapbox Batch Geocoding API

### Usage

```
mb_batch_geocode(  
  data,  
  search_column = NULL,  
  address_line1 = NULL,  
  address_number = NULL,  
  street = NULL,  
  block = NULL,  
  place = NULL,  
  region = NULL,  
  postcode = NULL,  
  locality = NULL,  
  neighborhood = NULL,  
  country = NULL,  
  permanent = FALSE,  
  limit = 1,  
  search_within = NULL,  
  language = NULL,  
  types = NULL,  
  proximity = NULL,  
  worldview = NULL,  
  allow_large_job = FALSE,  
  access_token = NULL,  
  sf = TRUE  
)
```

### Arguments

data	An input data frame
search_column	A column that contains a description of the place to geocode, or a full address. search_column cannot be used with address component arguments.
address_line1	The name of a column in data that contains the first line of an address, e.g. "1600 Pennsylvania Ave NW"
address_number	The name of a column in data that contains the address number, e.g. "1600". Not required when address_line1 is used.
street	The name of a column in data that contains the street name, e.g. "Pennsylvania Ave NW". Not required when address_line1 is used.

block	The name of a column in data that describes the block, used in some Japanese addresses.
place	The name of a column in data that contains the place name; typically a city, village, or municipality, e.g. "Washington"
region	The name of a column in data that represents sub-national administrative features, such as states in Mexico or the United States. Example: "DC"
postcode	The name of a column in data representing the postal code of the address; this will be a ZIP code in the United States, e.g. "20500"
locality	The name of a column in data that describes official sub-city locations, such as arrondissements in France.
neighborhood	The name of a column in data that represents a colloquial neighborhood name for the location.
country	A character string or vector of ISO 3166 alpha-2 country codes within which you would like to limit your search.
permanent	Either FALSE (the default) when results are not intended to be stored, or TRUE if the results are planned to be stored.
limit	How many results to return per address. This is not currently accessible for users and can only be 1.
search_within	An sf object, or vector representing a bounding box of format c(min_longitude, min_latitude, max_longitude, max_latitude) used to limit search results. Defaults to NULL.
language	The user's language, which can help with interpretation of queries. Available languages are found at <a href="https://docs.mapbox.com/api/search/#language-coverage">https://docs.mapbox.com/api/search/#language-coverage</a> .
types	A vector of feature types to limit to which the search should be limited. Available options include 'country', 'region', 'postcode', 'district', 'place', 'locality', 'neighborhood', 'address', 'street', 'block', 'address', and 'secondary_address'. If left blank, all types will be searched.
proximity	proximity Either a vector of coordinates or an IP address string to bias the results to favor locations near to the input location.
worldview	Returns features intended for different regional or cultural groups. The US ('us') world view is returned by default.
allow_large_job	A boolean indicating that the user is OK with potential charges incurred to their account due to a large geocoding job (over 1000 addresses). The Mapbox Free Tier includes 100,000 free geocodes per month. Defaults to FALSE.
access_token	The Mapbox access token (required); can be set with <code>mb_access_token()</code>
sf	A boolean that determines whether the output will be an sf POINT object (TRUE, the default) or a regular data frame (FALSE).

### Value

The input dataset as an sf POINT object representing the geocoded locations, or the input dataset with longitude, latitude, and matched address columns included.

---

`mb_directions`*Make a request to the Mapbox Directions API*

---

## Description

See the [Mapbox Directions API documentation](#) for more information.

## Usage

```
mb_directions(  
  input_data = NULL,  
  origin = NULL,  
  destination = NULL,  
  profile = "driving",  
  output = "sf",  
  depart_at = NULL,  
  alternatives = NULL,  
  annotations = NULL,  
  bearings = NULL,  
  continue_straight = NULL,  
  exclude = NULL,  
  geometries = "geojson",  
  overview = "simplified",  
  radiuses = NULL,  
  approaches = NULL,  
  steps = NULL,  
  banner_instructions = NULL,  
  language = NULL,  
  roundabout_exits = NULL,  
  voice_instructions = NULL,  
  voice_units = NULL,  
  waypoint_names = NULL,  
  waypoint_targets = NULL,  
  waypoints = NULL,  
  walking_speed = NULL,  
  walkway_bias = NULL,  
  alley_bias = NULL,  
  access_token = NULL  
)
```

## Arguments

<code>input_data</code>	An input dataset of class "sf", or a list of coordinate pairs for format <code>c(longitude, latitude)</code> . Cannot be used with an origin/destination pair.
<code>origin</code>	An address or coordinate pair that represents the origin of your requested route. Cannot be used with <code>input_data</code> .

destination	An address or coordinate pair that represents the destination of your requested route.
profile	One of "driving" (the default), "driving-traffic", "walking", or "cycling".
output	One of "sf" (the default), which returns an sf LINESTRING representing the route geometry, or "full", which returns the full request from the Directions API as a list.
depart_at	(optional) For the "driving" or "driving-traffic" profiles, the departure date and time to reflect historical traffic patterns. If "driving-traffic" is used, live traffic will be mixed in with historical traffic for dates/times near to the current time. Should be specified as an ISO 8601 date/time, e.g. "2022-03-31T09:00".
alternatives	Whether or not to return alternative routes with your request. If TRUE, a list of up to 3 possible routes will be returned.
annotations	A comma-separated string of additional route metadata, which may include duration, distance, speed, and congestion. Must be used with overview = "full".
bearings	A semicolon-delimited character string of bearings
continue_straight	continue_straight
exclude	Road types to exclude from your route; possible choices are 'toll', 'motorway', or 'ferry'. Defaults to NULL.
geometries	The route geometry format. If output = 'sf', you will get back an sf object and you should leave this blank. If output = 'full', the embedded route geometries will be one of 'geojson' (the default), 'polyline' with five decimal place precision, or 'polyline6'.
overview	If left blank, defaults to 'simplified' for simplified geometry; the other option is 'full' which provides the most detailed geometry available.
radiuses	A character string with semicolon-separated radii that specify the distance (in meters) to snap each input coordinate to the road network. Defaults to NULL.
approaches	A character string with semicolon-separated specifications for how to approach waypoints. Options include unrestricted and curb. Defaults to NULL which uses unrestricted for all waypoints.
steps	If TRUE, returns the route object split up into route legs with step-by-step instructions included. If FALSE or NULL (the default), a single line geometry representing the full route will be returned.
banner_instructions	Whether or not to return banner objects; only available when output = 'full' and steps = TRUE.
language	The language of the returned instructions (defaults to English). Available language codes are found at <a href="https://docs.mapbox.com/api/navigation/#instructions-languages">https://docs.mapbox.com/api/navigation/#instructions-languages</a> . Only available when steps = TRUE.
roundabout_exits	If TRUE, adds instructions for roundabout entrance and exit. Only available when steps = TRUE.
voice_instructions, voice_units	Only available when steps = TRUE and output = 'full'.

waypoint_names, waypoint_targets, waypoints	Only available when steps = TRUE and output = 'full'.
walking_speed	The walking speed in meters/second; available when profile = 'walking'.
walkway_bias	Can take values between -1 and 1, where negative numbers avoid walkways and positive numbers prefer walkways. Available when profile = 'walking'.
alley_bias	Can take values between -1 and 1, where negative numbers avoid alleys and positive numbers prefer alleys. Available when profile = 'walking'.
access_token	A Mapbox access token; which can be set with <code>mb_access_token()</code>

**Value**

An sf object (or list of sf objects), or full R list representing the API response.

**Examples**

```
## Not run:
library(mapboxapi)
library(leaflet)

my_route <- mb_directions(
  origin = "10 Avenue de Wagram, 75008 Paris France",
  destination = "59 Rue de Tocqueville, 75017 Paris France",
  profile = "cycling",
  steps = TRUE,
  language = "fr"
)

leaflet(my_route) %>%
  addMapboxTiles(
    style_id = "light-v9",
    username = "mapbox"
  ) %>%
  addPolylines()

## End(Not run)
```

---

mb_geocode	<i>Geocode an address or place description using the Mapbox Geocoding API</i>
------------	---

---

**Description**

See the [Mapbox Geocoding API documentation](#) for more information.

**Usage**

```

mb_geocode(
  search_text = NULL,
  structured_input = NULL,
  permanent = FALSE,
  autocomplete = TRUE,
  limit = 1,
  types = NULL,
  search_within = NULL,
  language = NULL,
  country = NULL,
  proximity = NULL,
  worldview = NULL,
  output = "coordinates",
  access_token = NULL
)

mb_reverse_geocode(
  coordinates,
  permanent = FALSE,
  limit = 1,
  language = NULL,
  types = NULL,
  country = NULL,
  worldview = NULL,
  output = "text",
  access_token = NULL
)

```

**Arguments**

<code>search_text</code>	The text to search, formatted as a character string. Can be an address, a location, or a description of a point of interest.
<code>structured_input</code>	A named list of structured address inputs, to be used in place of <code>search_text</code> when more formal address inputs are desired. Available parameters, to be used as the names of list elements, include <code>'address_line1'</code> , <code>'address_number'</code> , <code>'street'</code> , <code>'block'</code> , <code>'place'</code> , <code>'region'</code> , <code>'locality'</code> , <code>'neighborhood'</code> , and <code>'country'</code> . See here for more documentation: <a href="https://docs.mapbox.com/api/search/geocoding/#forward-geocoding-with-structured-input">https://docs.mapbox.com/api/search/geocoding/#forward-geocoding-with-structured-input</a> .
<code>permanent</code>	Either FALSE (the default) when results are not intended to be stored, or TRUE if the results are planned to be stored.
<code>autocomplete</code>	Whether or not to return autocomplete results. Defaults to FALSE.
<code>limit</code>	How many results to return; defaults to 1 (maximum 10).
<code>types</code>	A vector of feature types to limit to which the search should be limited. Available options include <code>'country'</code> , <code>'region'</code> , <code>'postcode'</code> , <code>'district'</code> , <code>'place'</code> ,

	'locality', 'neighborhood', 'address', street, block, address. and 'secondary_address'. If left blank, all types will be searched.
search_within	An sf object, or vector representing a bounding box of format c(min_longitude, min_latitude, max_longitude, max_latitude) used to limit search results. Defaults to NULL.
language	The user's language, which can help with interpretation of queries. Available languages are found at <a href="https://docs.mapbox.com/api/search/#language-coverage">https://docs.mapbox.com/api/search/#language-coverage</a> .
country	A character string or vector of ISO 3166 alpha-2 country codes within which you would like to limit your search.
proximity	Either a vector of coordinates or an IP address string to bias the results to favor locations near to the input location.
worldview	Returns features intended for different regional or cultural groups. The US ('us') world view is returned by default.
output	one of "text" (the default), which will return a character string or list of character strings representing the returned results; output = "sf", returning an sf object; or "full", which will return a list with the full API response.
access_token	The Mapbox access token (required); can be set with <a href="#">mb_access_token()</a>
coordinates	The coordinates of a location in format c(longitude, latitude) for which you'd like to return information.

**Value**

A character vector, list, or sf object representing the query results.

**Examples**

```
## Not run:
whitehouse <- mb_geocode("1600 Pennsylvania Ave, Washington DC")
## End(Not run)

## Not run:
mb_reverse_geocode(c(77.5958768, 12.9667046), limit = 5, types = "address")
## End(Not run)
```

## Description

This function returns isochrones from the Mapbox Navigation Service [Isochrone API](#). Isochrones are shapes that represent the reachable area around one or more locations within a given travel time. Isochrones can be computed for driving, walking, or cycling routing profiles, and can optionally be set to return distances rather than times. `mb_isochrone()` returns isochrones as simple features objects in the WGS 1984 geographic coordinate system.

## Usage

```
mb_isochrone(
  location,
  profile = "driving",
  time = c(5, 10, 15),
  distance = NULL,
  depart_at = NULL,
  access_token = NULL,
  denoise = 1,
  generalize = NULL,
  geometry = "polygon",
  output = "sf",
  rate_limit = 300,
  keep_color_cols = FALSE,
  id_column = NULL
)
```

## Arguments

location	A vector of form <code>c(longitude, latitude)</code> , an address that can be geocoded as a character string, or an <code>sf</code> object.
profile	One of "driving", "walking", "cycling", or "driving-traffic". "driving" is the default.
time	A vector of isochrone contours, specified in minutes. Defaults to <code>c(5, 10, 15)</code> . The maximum time supported is 60 minutes. Reflects traffic conditions for the date and time at which the function is called. If reproducibility of isochrones is required, supply an argument to the <code>depart_at</code> parameter.
distance	A vector of distance contours specified in meters. If supplied, will supercede any call to the <code>time</code> parameter as time and distance cannot be used simultaneously. Defaults to <code>NULL</code> .
depart_at	(optional) For the "driving" or "driving-traffic" profiles, the departure date and time to reflect historical traffic patterns. If "driving-traffic" is used, live traffic will be mixed in with historical traffic for dates/times near to the current time. Should be specified as an ISO 8601 date/time, e.g. "2022-03-31T09:00". If <code>NULL</code> (the default), isochrones will reflect traffic conditions at the date and time when the function is called.
access_token	A valid Mapbox access token.
denoise	A floating-point value between 0 and 1 used to remove smaller contours. 1 is the default and returns only the largest contour for an input time.

generalize	A value expressed in meters of the tolerance for the Douglas-Peucker generalization algorithm used to simplify the isochrone shapes. If NULL (the default), the Mapbox API will choose an optimal value for you.
geometry	one of "polygon" (the default), which returns isochrones as polygons, or alternatively "linestring", which returns isochrones as linestrings.
output	one of "sf" (the default), which returns an sf object representing the isochrone(s), or "list", which returns the GeoJSON response from the API as an R list.
rate_limit	The rate limit for the API, expressed in maximum number of calls per minute. For most users this will be 300 though this parameter can be modified based on your Mapbox plan. Used when location is "sf".
keep_color_cols	Whether or not to retain the color columns that the Mapbox API generates by default (applies when the output is an sf object). Defaults to FALSE.
id_column	If the input dataset is an sf object, the column in your dataset you want to use as the isochrone ID. Otherwise, isochrone IDs will be identified by row index or position.

### Value

An sf object representing the isochrone(s) around the location(s).

### Examples

```
## Not run:

library(mapboxapi)
library(mapdeck)
isochrones <- mb_isochrone("The Kremlin, Moscow Russia",
  time = c(4, 8, 12),
  profile = "walking"
)

mapdeck(style = mapdeck_style("light")) %>%
  add_polygon(
    data = isochrones,
    fill_colour = "time",
    fill_opacity = 0.5,
    legend = TRUE
  )

## End(Not run)
```

**Description**

Retrieve a matrix of travel times from the Mapbox Directions API

**Usage**

```
mb_matrix(
  origins,
  destinations = NULL,
  profile = "driving",
  fallback_speed = NULL,
  output = c("duration", "distance"),
  duration_output = c("minutes", "seconds"),
  access_token = NULL,
  depart_at = NULL,
  allow_large_matrix = FALSE
)
```

**Arguments**

origins	The input coordinates of your request. Acceptable inputs include a list of coordinate pair vectors in <code>c(x, y)</code> format or an <code>sf</code> object. For <code>sf</code> linestrings or polygons, the distance between centroids will be taken.
destinations	The destination coordinates of your request. If <code>NULL</code> (the default), a many-to-many matrix using origins will be returned.
profile	One of "driving" (the default), "driving-traffic", "walking", or "cycling".
fallback_speed	A value expressed in kilometers per hour used to estimate travel time when a route cannot be found between locations. The returned travel time will be based on the straight-line estimate of travel between the locations at the specified fallback speed.
output	one of "duration" (the default), which will be measured in either minutes or seconds (depending on the value of <code>duration_output</code> ), or "distance", which will be returned in meters.
duration_output	one of "minutes" (the default) or "seconds"
access_token	A Mapbox access token (required)
depart_at	(optional) For the "driving" or "driving-traffic" profiles, the departure date and time to reflect historical traffic patterns. If "driving-traffic" is used, live traffic will be mixed in with historical traffic for dates/times near to the current time. Should be specified as an ISO 8601 date/time, e.g. "2023-03-31T09:00". The time must be set to the current time or in the future.
allow_large_matrix	<code>mb_matrix()</code> will prevent the user from calculating large travel-time matrices (greater than 25x25) by default, as they may lead to unexpected charges. If the user sets this argument to <code>TRUE</code> , <code>mb_matrix()</code> will bypass this error and calculate the large matrix for the user. Defaults to <code>FALSE</code> .

**Value**

An R matrix of source-destination travel times.

**Examples**

```
## Not run:

library(mapboxapi)
library(tigris)
library(mapdeck)

philly_tracts <- tracts("PA", "Philadelphia", cb = TRUE, class = "sf")
downtown_philly <- mb_geocode("Philadelphia City Hall, Philadelphia PA")

time_to_downtown <- mb_matrix(philly_tracts, downtown_philly)

philly_tracts$time <- time_to_downtown

mapdeck(style = mapdeck_style("light")) %>%
  add_polygon(
    data = philly_tracts,
    fill_colour = "time",
    fill_opacity = 0.6,
    legend = TRUE
  )

## End(Not run)
```

---

mb\_optimized\_route      *Return an optimized route for a series of input coordinates*

---

**Description**

Return an optimized route for a series of input coordinates

**Usage**

```
mb_optimized_route(
  input_data,
  profile = c("driving", "walking", "cycling", "driving-traffic"),
  output = "sf",
  source = c("any", "first"),
  destination = c("any", "last"),
  roundtrip = TRUE,
  annotations = NULL,
  approaches = NULL,
  bearings = NULL,
  distributions = NULL,
```

```

language = NULL,
overview = "simplified",
radiuses = NULL,
steps = NULL,
access_token = NULL
)

```

### Arguments

input_data	An input dataset of class "sf", or a list of coordinate pairs of format c(longitude, latitude). Must be between 2 and 12 coordinate pairs.
profile	One of "driving" (the default), "driving-traffic", "walking", or "cycling".
output	One of "sf" (the default), which returns an sf LINESTRING representing the route geometry, or "full", which returns the full request from the Directions API as a list.
source	One of "any" (the default) or "first". If "any" is specified, any of the input coordinates may be used as the starting point. If "first" is specified, the first coordinate will be used.
destination	One of "any" (the default) or "last". If "any" is specified, any of the input coordinates may be used as the ending point. If "last" is specified, the last coordinate will be used.
roundtrip	If TRUE (the default), the route will start and end at the same point. roundtrip = FALSE only works when source is "first" and destination is "last". If FALSE is supplied here, the route will start at the first point in input_data and end at the last point.
annotations	A comma-separated string of additional route metadata, which may include duration, distance, speed, and congestion. Must be used with overview = "full".
approaches	A character string with semicolon-separated specifications for how to approach waypoints. Options include unrestricted and curb. Defaults to NULL which uses unrestricted for all waypoints.
bearings	A semicolon-delimited character string of bearings.
distributions	A semicolon-delimited character string of number pairs that specifies pick-up and drop-off locations. The first number indicates the index of the pick-up location, and the second number represents the index of the drop-off location.
language	The language of the returned instructions (defaults to English). Available language codes are found at <a href="https://docs.mapbox.com/api/navigation/#instructions-languages">https://docs.mapbox.com/api/navigation/#instructions-languages</a> . Only available when steps = TRUE.
overview	If left blank, defaults to 'simplified' for simplified geometry; the other option is 'full' which provides the most detailed geometry available.
radiuses	A character string with semicolon-separated radii that specify the distance (in meters) to snap each input coordinate to the road network. Defaults to NULL.
steps	If TRUE, returns the route object split up into route legs with step-by-step instructions included. If FALSE or NULL (the default), a single line geometry representing the full route will be returned.
access_token	Your Mapbox access token; which can be set with <a href="#">mb_access_token()</a>

**Value**

Either a list of two `sf` objects - one representing the waypoints, and one representing the route - or an R list representing the full optimization API response.

**Examples**

```
## Not run:

library(mapboxapi)
library(sf)

to_visit <- data.frame(
  X = c(-0.209307, -0.185875, -0.216877, -0.233511, -0.234541),
  Y = c(5.556019, 5.58031, 5.582528, 5.566771, 5.550209)
) %>%
  st_as_sf(coords = c("X", "Y"), crs = 4326)

optimized_route <- mb_optimized_route(to_visit,
  profile = "driving-traffic"
)

## End(Not run)
```

---

<code>mts_create_source</code>	<i>Create a Mapbox tileset source from a <code>sf</code> object using the Mapbox Tiling Service API</i>
--------------------------------	---

---

**Description**

The `mts_create_source()` function can be used to create a tileset source or append to an existing tileset source. This function publishes a simple features object you've created in R to your Mapbox account, where it is stored as line-delimited GeoJSON. A tileset source is required to create a vector tileset, and the same source can be used across multiple tilesets.

**Usage**

```
mts_create_source(data, tileset_id, username, access_token = NULL)
```

**Arguments**

<code>data</code>	An input simple features object
<code>tileset_id</code>	The tileset ID. If the tileset ID already exists in your Mapbox account, this function will overwrite the existing source with a new source.
<code>username</code>	Your Mapbox username
<code>access_token</code>	Your Mapbox access token with secret scope. Install with <code>mb_access_token()</code> after you retrieve it from your Mapbox account.

**Value**

A list of the MTS API's responses, including the name of the tileset source in your Mapbox account. You'll use this name to build a MTS recipe.

**See Also**

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#create-a-tileset-source>

**Examples**

```
## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age
us_median_age_tract <- get_acs(
  geography = "tract",
  variables = "B01002_001",
  state = c(state.abb, "DC"),
  year = 2020,
  geometry = TRUE
)

# Get it for counties as well
us_median_age_county <- get_acs(
  geography = "county",
  variables = "B01002_001",
  year = 2020,
  geometry = TRUE
)

# Create a source from the datasets
mts_create_source(data = us_median_age_tract,
  tileset_id = "us_median_age_tract",
  username = "your_mapbox_username")

mts_create_source(data = us_median_age_county,
  tileset_id = "us_median_age_county",
  username = "your_mapbox_username")

# Build out the recipe. First, create a recipe layer with
# appropriate options. We'll want a larger tile size and to restrict the minzoom
# to 4; a maxzoom of 12 will be fine as we can overzoom beyond that
#
# Your source ID will be returned by `mts_create_source()`, so use that value
tract_layer <- recipe_layer(
  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_tract",
  minzoom = 4,
  maxzoom = 12,
  tiles = tile_options(layer_size = 2500)
)
```

```

county_layer <- recipe_layer(
  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_county",
  minzoom = 2,
  maxzoom = 5
)

recipe <- mts_make_recipe(tracts = tract_layer, counties = county_layer)

# Validate the recipe
mts_validate_recipe(recipe)

# Create a tileset from the recipe
mts_create_tileset(tileset_name = "median_age_acs",
                  username = "your_mapbox_username",
                  recipe = recipe)

# Publish the tileset
mts_publish_tileset(tileset_name = "median_age_acs",
                  username = "your_mapbox_username")

# If necessary, update the recipe
mts_update_recipe(tileset_name = "median_age_acs",
                 username = "your_mapbox_username",
                 recipe = new_recipe)

# Publish the tileset again after you've updated the recipe
mts_publish_tileset(tileset_name = "median_age_acs",
                  username = "your_mapbox_username")

## End(Not run)

```

---

mts\_create\_tileset      *Create a tileset with the Mapbox Tiling Service API*

---

## Description

After you've uploaded your spatial data to your Mapbox account with `mts_create_source` and prepared a valid recipe with `mts_make_recipe()`, you can use your source and recipe to create a vector tileset. This tileset will be hosted at your Mapbox account. Once created successfully, you will need to publish the tileset using `mts_publish_tileset` to use it in Mapbox Studio, Mapbox GL JS, or an R package that can read Mapbox tilesets.

## Usage

```

mts_create_tileset(
  tileset_name,
  username,
  recipe,

```

```

    request_name = tileset_name,
    access_token = NULL
  )

```

### Arguments

tileset_name	The name of the MTS tileset you intend to create
username	Your Mapbox username
recipe	An MTS recipe, created with <code>mts_make_recipe()</code>
request_name	The name of the request; defaults to the tileset name
access_token	Your Mapbox access token

### Value

The response from the API, formatted as an R list.

### See Also

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#create-a-tileset>

### Examples

```

## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age
us_median_age_tract <- get_acs(
  geography = "tract",
  variables = "B01002_001",
  state = c(state.abb, "DC"),
  year = 2020,
  geometry = TRUE
)

# Get it for counties as well
us_median_age_county <- get_acs(
  geography = "county",
  variables = "B01002_001",
  year = 2020,
  geometry = TRUE
)

# Create a source from the datasets
mts_create_source(data = us_median_age_tract,
  tileset_id = "us_median_age_tract",
  username = "your_mapbox_username")

mts_create_source(data = us_median_age_county,
  tileset_id = "us_median_age_county",

```

```

        username = "your_mapbox_username")

# Build out the recipe.  First, create a recipe layer with
# appropriate options.  We'll want a larger tile size and to restrict the minzoom
# to 4; a maxzoom of 12 will be fine as we can overzoom beyond that
#
# Your source ID will be returned by `mts_create_source()`, so use that value
tract_layer <- recipe_layer(
  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_tract",
  minzoom = 4,
  maxzoom = 12,
  tiles = tile_options(layer_size = 2500)
)

county_layer <- recipe_layer(
  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_county",
  minzoom = 2,
  maxzoom = 5
)

## End(Not run)

```

---

mts\_get\_recipe

*Retrieve the recipe for an MTS tileset in your Mapbox account*

---

## Description

Retrieve the recipe for an MTS tileset in your Mapbox account

**Usage**

```
mts_get_recipe(tileset_name, username, access_token = NULL)
```

**Arguments**

tileset_name	The tileset name for which you'd like to retrieve a recipe
username	Your Mapbox username
access_token	Your Mapbox access token with secret scope

**Value**

The recipe for your tileset as an R list

**See Also**

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#retrieve-a-tilesets-recipe>

**Examples**

```
## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age

```

---

mts\_list\_sources

*List tileset sources in your Mapbox account*

---

## Description

List tileset sources in your Mapbox account

**Usage**

```
mts_list_sources(  
  username,  
  sortby = c("created", "modified"),  
  limit = 100,  
  start = NULL,  
  access_token = NULL  
)
```

**Arguments**

username	Your Mapbox username
sortby	One of "created" or "modified"; the returned data frame will be sorted by one of these two options.
limit	The number of tileset sources to return; defaults to 100. The maximum number of tileset sources returned by this endpoint is 2000.
start	The source ID at which to start the list of sources; defaults to NULL.
access_token	Your Mapbox access token with secret scope.

**Value**

A data frame containing information on your tileset sources.

**See Also**

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#create-a-tileset-source>

**Examples**

```
## Not run:  
source_list <- mts_list_sources(username = "your_mapbox_username")  
  
## End(Not run)
```

---

mts_list_tilesets	<i>List tilesets in a Mapbox account</i>
-------------------	--

---

**Description**

List tilesets in a Mapbox account

**Usage**

```
mts_list_tilesets(  
  username,  
  type = NULL,  
  visibility = NULL,  
  sortby = c("created", "modified"),  
  limit = 100,  
  start = NULL,  
  access_token = NULL  
)
```

**Arguments**

username	A Mapbox username
type	(optional) Return only "vector" or "raster" tilesets. If left blank, all tilesets will be returned.
visibility	Return only "public" or "private" tilesets. Public tilesets can be returned with any public access token; private tilesets require the user's access token with secret scope.
sortby	One of "created" or "modified"; the returned data frame will be sorted by one of these two options.
limit	The number of tilesets to return; defaults to 100. The maximum number of tilesets returned by this endpoint is 500.
start	The tileset ID at which to start the list of sources; defaults to NULL.
access_token	Your Mapbox access token with secret scope.

**Value**

A data frame containing information on available tilesets in a given Mapbox account.

**See Also**

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#list-tilesets>

**Examples**

```
## Not run:  
tileset_list <- mts_list_tilesets(username = "your_mapbox_username")  
  
## End(Not run)
```

---

mts_make_recipe	<i>Prepare a recipe for use with the Mapbox Tiling Service</i>
-----------------	--

---

## Description

Prepare a recipe for use with the Mapbox Tiling Service

## Usage

```
mts_make_recipe(...)
```

## Arguments

... One or more named lists that represent layers in the Mapbox Tiling Service recipe specification (<https://docs.mapbox.com/mapbox-tiling-service/reference/#layer-example>). These lists can be prepared with the helper function `recipe_layer()`, or prepared by hand if the user prefers. If multiple layers are included, a multi-layer recipe will be prepared that can produce tilesets with multiple sources.

## Value

An R list representing an MTS recipe to be used to create a tileset.

## See Also

<https://docs.mapbox.com/mapbox-tiling-service/reference/>

## Examples

```
## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age
us_median_age_tract <- get_acs(
  geography = "tract",
  variables = "B01002_001",
  state = c(state.abb, "DC"),
  year = 2020,
  geometry = TRUE
)

# Get it for counties as well
us_median_age_county <- get_acs(

  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_tract",
  minzoom = 4,
  maxzoom = 12,
  tiles = tile_options(layer_size = 2500)
)

county_layer <- recipe_layer(
  source = "mapbox://tileset-source/your_mapbox_username/us_median_age_county",
  minzoom = 2,
  maxzoom = 5
)

recipe <- mts_make_recipe(tracts = tract_layer, counties = county_layer)

# Validate the recipe
mts_validate_recipe(recipe)

# Create a tileset from the recipe
mts_create_tileset(tileset_name = "median_age_acs",
                  username = "your_mapbox_username",
                  recipe = recipe)

# Publish the tileset
mts_publish_tileset(tileset_name = "median_age_acs",
                  username = "your_mapbox_username")

# If necessary, update the recipe
mts_update_recipe(tileset_name = "median_age_acs",
                 username = "your_mapbox_username",
                 recipe = new_recipe)

# Publish the tileset again after you've updated the recipe
mts_publish_tileset(tileset_name = "median_age_acs",
                  username = "your_mapbox_username")
```

```
## End(Not run)
```

---

mts\_publish\_tileset     *Publish a tileset with Mapbox Tiling Service*

---

## Description

mts\_publish\_tileset() publishes an existing vector tileset at your Mapbox account, allowing you to use the vector tiles in your projects. The tileset name will be the same name you specified in mts\_create\_tileset().

## Usage

```
mts_publish_tileset(tileset_name, username, access_token = NULL)
```

## Arguments

tileset_name	The name of the tileset (as supplied to mts_create_tileset())
username	Your Mapbox username
access_token	Your Mapbox access token

## Details

The published tileset will conform to rules specified in its recipe. If you want to change the recipe for a tileset, use mts\_update\_recipe() then re-publish the tileset with a call to mts\_publish\_tileset() once more.

## Value

The response from the Mapbox Tiling Service API, formatted as an R list.

## See Also

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#publish-a-tileset>

## Examples

```
## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age

## End(Not run)
```

---

mts\_update\_recipe      *Update a tileset's MTS recipe*

---

## Description

Update a tileset's MTS recipe

## Usage

```
mts_update_recipe(tileset_name, username, recipe, access_token = NULL)
```

## Arguments

tileset_name	The name of your Mapbox tileset
username	Your Mapbox username
recipe	The new recipe for your tileset, likely created with <code>mts_make_recipe()</code> .
access_token	Your Mapbox access token

## Value

If the update is successful, the function will print a message informing you of its success. Otherwise, a list of responses from the API will be returned letting you know why the request was invalid.

## See Also

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#update-a-tilesets-recipe>

## Examples

```
## Not run:

## End(Not run)
```

---

mts\_validate\_recipe    *Validate a Mapbox Tiling Service recipe*

---

## Description

Validate a Mapbox Tiling Service recipe

## Usage

```
mts_validate_recipe(recipe, access_token = NULL)
```

## Arguments

recipe            A recipe list, created with mts\_make\_recipe()  
access\_token     Your Mapbox access token.

## Value

A response from the API indicating whether the MTS recipe is valid or not. If the recipe is valid, returns TRUE, allowing you to use the output of this function for error handling pipelines. If the recipe is invalid, the function returns FALSE and prints the API response telling you why the recipe is invalid.

## See Also

<https://docs.mapbox.com/api/maps/mapbox-tiling-service/#validate-a-recipe>

## Examples

```
## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age

## End(Not run)

```

---

```
prep_overlay_markers Prepare overlay markers for use in a Mapbox static map
```

---

## Description

Markers are prepared to match GeoJSON [marker-spec](#) which is a partial implementation of the GeoJSON [simplestyle-spec](#) (described as a work-in-progress by Mapbox).

## Usage

```

prep_overlay_markers(
  data = NULL,
  marker_type = c("pin-s", "pin-l", "url"),
  label = NA,
  color = NA,
  longitude = NULL,
  latitude = NULL,
  url = NA
)

```

## Arguments

<code>data</code>	An input data frame with longitude and latitude columns (X and Y or lon and lat as names are also acceptable) or an sf object with geometry type POINT.
<code>marker_type</code>	The marker type; one of "pin-s", for a small pin; "pin-l", for a large pin; and "url", for an image path. If <code>marker_type</code> is the same length as the rows in <code>data</code> , a mix of different marker types are allowed.
<code>label</code>	The marker label (optional). Can be a letter, number (0 through 99), or a valid Maki icon (see <a href="https://labs.mapbox.com/maki-icons/">https://labs.mapbox.com/maki-icons/</a> ) for options).
<code>color</code>	The marker color (optional). <code>color</code> can be specified as a color name or as a three or six-digit hexadecimal code (with or without the number sign).
<code>longitude</code>	A vector of longitudes; inferred from the input dataset if <code>data</code> is provided.
<code>latitude</code>	A vector of latitudes; inferred from the input dataset if <code>data</code> is provided.
<code>url</code>	The URL of the image to be used for the icon if <code>marker_type = "url"</code> .

**Value**

A formatted list of marker specifications that can be passed to the `static_mapbox` function.

---

query_tiles	<i>Get information about features in a tileset using the Tilequery API</i>
-------------	--

---

**Description**

Get information about features in a tileset using the Tilequery API

**Usage**

```
query_tiles(
  location,
  tileset_id,
  radius = 0,
  limit = 5,
  dedupe = TRUE,
  geometry = NULL,
  layers = NULL,
  access_token = NULL
)
```

**Arguments**

location	The location for which you'd like to query tiles, expressed as either a length-2 vector of longitude and latitude or an address you'd like to geocode.
tileset_id	The tileset ID to query.
radius	The radius around the point (in meters) for which you'd like to query features. For point-in-polygon queries (e.g. "what county is my point located in?") the default of 0 should be used.
limit	How many features to return (defaults to 5). Can be an integer between 1 and 50.
dedupe	Whether or not to return duplicate features as identified by their IDs. The default, TRUE, will de-duplicate your dataset.
geometry	The feature geometry type to query - can be "point", "linestring", or "polygon". If left blank, all geometry types will be queried.
layers	A vector of layer IDs you'd like to query (recommended); if left blank will query all layers, with the limitation that at most 50 features can be returned.
access_token	A Mapbox access token, which can be set with <code>mb_access_token()</code> .

**Value**

An R list containing the API response, which includes information about the requested features. Parse the list to extract desired elements.

**See Also**

<https://docs.mapbox.com/help/tutorials/find-elevations-with-tilequery-api/>

**Examples**

```
## Not run:

library(mapboxapi)

elevation <- query_tiles(
  location = "Breckenridge, Colorado",
  tileset_id = "mapbox.mapbox-terrain-v2",
  layer = "contour",
  limit = 50
)

max(elevation$features$properties$ele)

## End(Not run)
```

---

recipe\_layer

*Prepare a formatted recipe layer for use in a Mapbox Tiling Service recipe*

---

**Description**

Prepare a formatted recipe layer for use in a Mapbox Tiling Service recipe

**Usage**

```
recipe_layer(
  source,
  minzoom,
  maxzoom,
  features = feature_options(),
  tiles = tile_options()
)
```

**Arguments**

source	The tileset source ID. This is returned by <code>mts_create_source()</code> or can be retrieved from your Mapbox account with <code>mts_list_sources()</code> .
minzoom	The minimum zoom level at which a layer can be viewed.
maxzoom	The maximum zoom level at which a layer is rendered; the layer will still be visible past the maximum zoom level due to overzooming.
features	A list of feature options, possibly generated with <code>feature_options()</code> .
tiles	A list of tile options, possibly generated with <code>tile_options()</code>

**Value**

A recipe layer list to be used in `mts_make_recipe()`.

**See Also**

<https://docs.mapbox.com/mapbox-tiling-service/reference/>

**Examples**

```
## Not run:
library(tidycensus)
library(mapboxapi)

  username = "your_mapbox_username")

## End(Not run)

```

---

static\_mapbox

*Return a static Mapbox map from a specified style*

---

## Description

This function uses the [Mapbox Static Maps API](#) to return a pointer to an "magick-image" class image or a [http::response](#) object from the static map image URL.

## Usage

```

static_mapbox(
  location = NULL,
  buffer_dist = 1000,
  units = "m",
  style_id,
  username,
  style_url = NULL,
  overlay_sf = NULL,

```

```

overlay_style = NULL,
overlay_markers = NULL,
longitude = NULL,
latitude = NULL,
zoom = NULL,
width = NULL,
height = NULL,
bearing = NULL,
pitch = NULL,
scale = 0.5,
scaling_factor = c("1x", "2x"),
attribution = TRUE,
logo = TRUE,
before_layer = NULL,
access_token = NULL,
image = TRUE,
strip = TRUE
)

```

## Arguments

location	An input location for which you would like to request tiles. Can be a length-4 vector representing a bounding box, or an <code>sf</code> object. If an input <code>sf</code> object is supplied, use the <code>buffer_dist</code> argument to control how much area you want to capture around the layer. While the input <code>sf</code> object can be in an arbitrary coordinate reference system, if a length-4 bounding box vector is supplied instead it must represent WGS84 longitude/latitude coordinates and be in the order <code>c(xmin, ymin, xmax, ymax)</code> .
buffer_dist	The distance to buffer around an input <code>sf</code> object for determining static map, specified in units. If location is a <code>POINT</code> object of 2 rows or less and <code>buffer_dist</code> is 0 or <code>NULL</code> , a 1 unit buffer is applied to try to ensure the creation of a valid bounding box for the map area.
units	Units of <code>buffer_dist</code> ; defaults to "m" (meters). If <code>buffer_dist</code> is a units class object, the units argument is ignored.
style_id	A style ID (required if <code>style_url</code> is <code>NULL</code> ).
username	A Mapbox username (required if <code>style_url</code> = <code>NULL</code> ).
style_url	A Mapbox style url; defaults to <code>NULL</code> .
overlay_sf	The overlay <code>sf</code> object (optional). The function will convert the <code>sf</code> object to GeoJSON then plot over the basemap style. Spatial data that are too large will trigger an error, and should be added to the style in Mapbox Studio instead.
overlay_style	A named list of vectors specifying how to style the <code>sf</code> overlay. Possible names are "stroke", "stroke-width" (or "stroke_width"), "stroke-opacity" (or "stroke_opacity"), "fill", and "fill-opacity" (or "fill_opacity"). The fill and stroke color values can be specified as six-digit hex codes or color names, and the opacity and width values should be supplied as floating-point numbers. If <code>overlay_style</code> is <code>NULL</code> , the style values can be pulled from columns with the same names in <code>overlay_sf</code> .

overlay_markers	The prepared overlay markers (optional). See the function <a href="#">prep_overlay_markers</a> for more information on how to specify a marker overlay.
longitude, latitude	The longitude and latitude of the map center. If an overlay is supplied, the map will default to the extent of the overlay unless longitude, latitude, and zoom are all specified.
zoom	The map zoom. The map will infer this from the overlay unless longitude, latitude, and zoom are all specified.
width, height	The map width and height; defaults to NULL
pitch, bearing	The map pitch and bearing; defaults to NULL. pitch can range from 0 to 60, and bearing from -360 to 360.
scale	ratio to scale the output image; scale = 1 will return the largest possible image. defaults to 0.5
scaling_factor	The scaling factor of the tiles; either "1x" (the default) or "2x"
attribution	Controls whether there is attribution on the image. Defaults to TRUE. If FALSE, the watermarked attribution is removed from the image. You still have a legal responsibility to attribute maps that use OpenStreetMap data, which includes most maps from Mapbox. If you specify attribution = FALSE, you are legally required to include proper attribution elsewhere on the webpage or document.
logo	Controls whether there is a Mapbox logo on the image. Defaults to TRUE.
before_layer	A character string that specifies where in the hierarchy of layer elements the overlay should be inserted. The overlay will be placed just above the specified layer in the given Mapbox styles. List layer ids for a map style with <code>get_style(style_id = style_id, username = username, style_url = style_url, access_token = access_token)[["layers"]][["id"]]</code>
access_token	A Mapbox access token; which can be set with <a href="#">mb_access_token</a> .
image	If FALSE, return the a <a href="#">http::response</a> object from <a href="#">http::GET</a> using the static image URL; defaults to TRUE.
strip	If TRUE, drop image comments and metadata when image = TRUE; defaults to TRUE.

### Value

A pointer to an image of class "magick-image" if image = TRUE. The resulting image can be manipulated further with functions from the magick package.

### Examples

```
## Not run:

library(mapboxapi)

points_of_interest <- tibble::tibble(
  longitude = c(-73.99405, -74.00616, -73.99577, -74.00761),
  latitude = c(40.72033, 40.72182, 40.71590, 40.71428)
```

```
)

prepped_pois <- prep_overlay_markers(
  data = points_of_interest,
  marker_type = "pin-l",
  label = 1:4,
  color = "fff"
)

map <- static_mapbox(
  style_id = "streets-v11",
  username = "mapbox",
  overlay_markers = prepped_pois,
  width = 1200,
  height = 800
)

map

## End(Not run)
```

---

tile\_options

*Specify tile options for an MTS recipe layer*

---

## Description

Specify tile options for an MTS recipe layer

## Usage

```
tile_options(
  bbox = NULL,
  extent = NULL,
  buffer_size = NULL,
  limit = NULL,
  union = list(
    where = NULL,
    group_by = NULL,
    aggregate = NULL,
    maintain_direction = NULL,
    simplification = NULL
  ),
  filter = NULL,
  attributes = NULL,
  order = NULL,
  remove_filled = NULL,
  id = NULL,
  layer_size = NULL
)
```

**Arguments**

bbox, extent, buffer\_size, limit, union, filter, attributes, order,  
remove\_filled, id, layer\_size

Tile options in the MTS recipe. See <https://docs.mapbox.com/mapbox-tiling-service/reference/#tile-configuration> for more information on the available options.

**Value**

A list of tile options, likely to be used in recipe\_layer.

**See Also**

<https://docs.mapbox.com/mapbox-tiling-service/reference/>

**Examples**

```
## Not run:
library(tidycensus)
library(mapboxapi)
options(tigris_use_cache = TRUE)

# Get the national data on median age
us_median_age_tract <- get_acs(
  geography = "tract",
  variables = "B01002_001",
  state = c(state.abb, "DC"),
  year = 2020,
  geometry = TRUE
)

# Get it for counties as well
us_median_age_county <- get_acs(
  geography = "county",
  variables = "B01002_001",
  year = 2020,
  geometry = TRUE
)

# Create a source from the datasets
mts_create_source(data = us_median_age_tract,
  tileset_id = "us_median_age_tract",

  username = "your_mapbox_username")

# If necessary, update the recipe
mts_update_recipe(tileset_name = "median_age_acs",
  username = "your_mapbox_username",
  recipe = new_recipe)

# Publish the tileset again after you've updated the recipe
mts_publish_tileset(tileset_name = "median_age_acs",
  username = "your_mapbox_username")

## End(Not run)
```

---

tippecanoe

*Generate an .mbtiles file with tippecanoe*

---

## Description

Tippecanoe is a tile-generation utility for building vector tilesets from large (or small) collections of GeoJSON, Geobuf, or CSV features. The [tippecanoe](#) function requires that the tippecanoe utility is installed on your system; see the tippecanoe documentation for [installation instructions](#). Once installed, tippecanoe can be used in large visualization workflows in concert with Mapbox Studio.

**Usage**

```
tippecanoe(
  input,
  output,
  layer_name = NULL,
  min_zoom = NULL,
  max_zoom = NULL,
  drop_rate = NULL,
  overwrite = TRUE,
  other_options = NULL,
  keep_geojson = FALSE
)
```

**Arguments**

input	The dataset from which to generate vector tiles. Can be an sf object or GeoJSON file on disk.
output	The name of the output .mbtiles file (with .mbtiles extension). Will be saved in the current working directory.
layer_name	The name of the layer in the output .mbtiles file. If NULL, will either be a random string (if input is an sf object) or the name of the input GeoJSON file (if input is a file path).
min_zoom, max_zoom	The minimum and maximum zoom levels for which to compute tiles. If both min_zoom and max_zoom are blank, tippecanoe will guess the best zoom levels for your data.
drop_rate	The rate at which tippecanoe will drop features as you zoom out. If NULL, tippecanoe will drop features as needed in the densest tiles to stay within Mapbox's limits.
overwrite	If TRUE, an existing .mbtiles file with the same name will be overwritten.
other_options	A character string of other options to be passed to the tippecanoe program.
keep_geojson	Whether or not to keep the temporary CSV or GeoJSON file used to generate the tiles. Defaults to FALSE.

**Details**

Mapbox also offers the [Mapbox Tiling Service](#) as an alternate way to transform datasets into vector tiles.

**Examples**

```
## Not run:

# Workflow: create a dynamic tileset for dot-density mapping
library(tidycensus)
library(sf)
library(mapboxapi)
```

```
# Get population data for Census tracts in Vermont
vt_population <- get_decennial(
  geography = "tract",
  variables = "P001001",
  state = "Vermont",
  year = 2010,
  geometry = TRUE
)

# Convert to representative dots - 1 per person
vt_dots <- st_sample(
  vt_population,
  size = vt_population$value
)

# Use tippecanoe to create dynamic tiles
tippecanoe(
  input = vt_dots,
  output = "vt_population.mbtiles",
  layer_name = "vermont_population",
  max_zoom = 18,
  drop_rate = 1.5
)

# Upload to your Mapbox account for visualization
# A Mapbox secret access token must be set with mb_access_token()
# to upload data to your account
upload_tiles(
  input = "vt_population.mbtiles",
  username = "kwalkertcu",
  tileset_id = "vt_population_dots",
  multipart = TRUE
)

## End(Not run)
```

---

upload\_tiles

*Upload dataset to your Mapbox account*

---

### **Description**

Upload dataset to your Mapbox account

### **Usage**

```
upload_tiles(
  input,
  username,
```

```

    access_token = NULL,
    tileset_id = NULL,
    tileset_name = NULL,
    keep_geojson = FALSE,
    multipart = FALSE
  )

```

### Arguments

input	An sf object, or the path to the dataset to upload as a character string.
username	Your Mapbox username
access_token	Your Mapbox access token; must have secret scope
tileset_id	The ID of the tileset in your Mapbox account
tileset_name	The name of the tileset in your Mapbox account
keep_geojson	Whether or not to keep the temporary GeoJSON used to generate the tiles (if the input is an sf object)
multipart	Whether or not to upload to the temporary AWS staging bucket as a multipart object; defaults to FALSE.

### Examples

```

## Not run:

# Example: create a tileset of median age for all United States Census tracts
# Requires setting a Mapbox secret access token as an environment variable

library(mapboxapi)
library(tidycensus)
options(tigris_use_cache = TRUE)

median_age <- get_acs(
  geography = "tract",
  variables = "B01002_001",
  state = c(state.abb, "DC"),
  geometry = TRUE
)

upload_tiles(
  input = median_age,
  username = "kwalkertcu", # Your username goes here
  tileset_id = "median_age",
  tileset_name = "us_median_age_2014_to_2018"
)

## End(Not run)
